PAPER 2

The Nature of Information Fields Properties and Communication

Leadership and innovation are the most powerful forces for driving success in any business. The main issue is: How to leverage management through these powerful forces and how to create sustainable magic in your business? We will share with you our experience in how to explore the information fields, the importance of fractals, some “time” considerations as well as the important role of global scaling.

In 14 different papers we will convey to you the knowledge and techniques of how to leverage management skills and how to transform your business into a company with continual drive and sustainable growth. The tools of awareness presented in these papers will probably be new to most of the readers; therefore we suggest NOT skipping a part before passing on to another one.

The 14 papers will guide you through a portfolio of new concepts combined with leadership and innovation skills. Take this opportunity to learn about and to

familiarize with information fields and the scientific background of how to communicate with them. We explain very clearly how and where on each management's or entrepreneur's level these new tools can be successfully applied.

In order to avoid questions such as "how is this possible?" or any other uncertainties please read carefully all papers one after the other.

Information fields are a fairly new concept to most of us. There are a growing number of publications mentioning information as such and sometimes also use the term "information fields". On many occasions the information issue is not very clearly defined with regard to the energy issue. Both terms mean a completely different thing, and although strongly related, they have each a very different nature, property and meaning. We have all been educated in a mechanical world, where energy and matter were prevailing issues. No place for information as such...

This is not the fault of Einstein or quantum mechanics as certain people try to let you believe. Unfortunately the $E=mc^2$ is known by everybody but hardly understood by anyone! While some people tell you how stupid this formula is, because it only takes into account mass and energy (and therefore no information), others even go further saying that $E=mc^2$ is of no use because using this formula you cannot prove that photons (light) have no mass. The reason for this misunderstanding is that they probably do not know that $E=mc^2$ is only valid in a reference scheme where everything is at rest, which is not the case with photons considering that they are never at rest. Real scientists will explain you that in the case of photons there is another formula available. Anyway, let's move on the right track, and study the nature of information fields.

We will give you a very simple and clear example we use in our seminars of how to cope with the relationship between Information and energy and how information "creates" and "directs" energy:

Imagine you will attend an interesting seminar today. You are looking forward to join and you are mentally preparing yourself for the course. In other words, the energy is positive and high! You leave the breakfast room with a big smile, direction seminar room. As you register, the lady at the desk tells you that she just received a call from your partner at home, "informing" you that the bailiff is standing on your doorstep! Even if you are convinced of the fact that this is impossible, this "information", will drop your "energy" to the lowest possible level, and it is not very likely that you still will have that relaxed smile on your face during the seminar (at least if you still have the "energy" to attend...)

This simple example clearly shows you the importance of information.

Information fields are sometimes related to concepts such as *Chu, Ether, Orgone, Shiva/Shakita concepts, Zero Point, Free Energy, Akashic Records* and many others. The most important and most complete are the *Morphic Fields* from Rupert Sheldrake.

Today, there is more than plenty material on the web regarding those concepts, so that we will not go into further detail. Only one remark: most of those concepts are related to, but therefore not identical. As explained earlier, information fields (or

morphic fields as described by Sheldrake) don't contain energy, but they are an organizing principle responsible for the creation and direction of energy. This is very important, because, as mentioned earlier, information is to be found in the information fields X7 and X8, and these fields are in a superior position than the structural fields X5 and X6, the fields where energy is created in function of which priorities are coming through from the information fields.

We gave many seminars, and also attended at least as many. So one day we decided to attend a quantum healing seminar in Germany (one of the many!). The instructor tried to explain the background of the (copied) system he used referring to Rupert Sheldrake's morphic fields, being full of energy! Everyone who has read Sheldrake knows that he never wrote or said such a thing. It was very embarrassing, especially that the instructor openly admitted before an audience of at least 60 people, never having read any of Sheldrake's books, but he "knew" that information fields were very energetic. Very painful if you know that the weekend training cost was many hundreds of Euro's per person.

All processes, being natural or man-made, are associated with information fields. A change in any of them does therefore *not* imply a change in the other. The reason is that the information fields "dictate" the energy fields. This does not mean that the information fields don't pick up and contain "new" elements, on the contrary, but be aware of the fact that information fields contain all possible information, so also the one that we don't know yet. Later we will explain in which form this information is available, and how we can communicate with them.

Quantum healing is a good example that shows very clearly how the available information can be used with imaginative and creative efforts backed up with intention. New pathways of body functioning can be formed and are accessible to everybody. In our opinion it is not necessary to explain to "connect" various points with an "imaginary" wave that "collapses" and the "patient" has to drop to the ground. We have seen shows where many people did not dare to say they had not felt anything of fear to be expelled of the group. We do not need to go that far to show people how good information can be used, and this without applying the quantum theory.

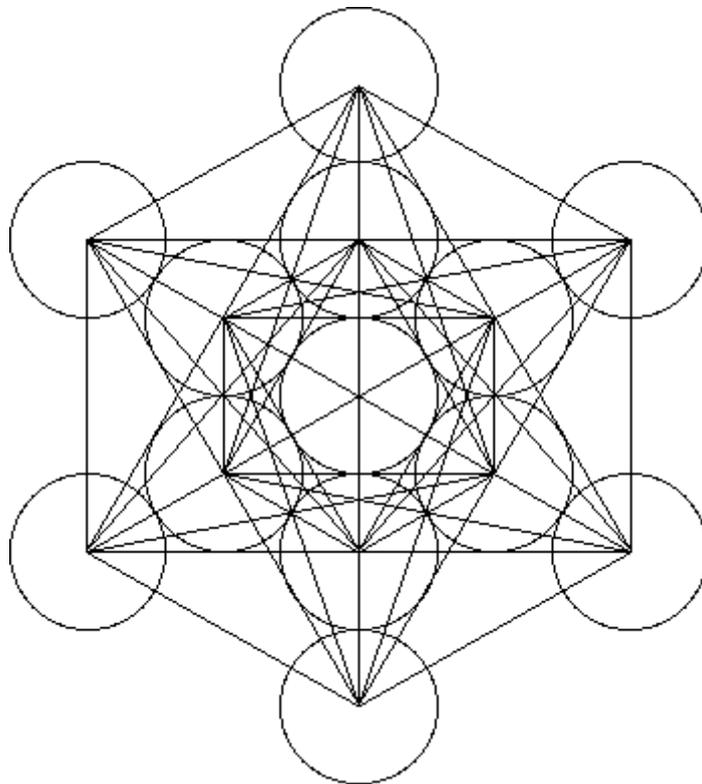

In other papers we will introduce you to the science of Global Scaling, developed in the 1980's by Dr. Hartmut Müller at the Academy of Science in St Petersburg in Russia. To us, this is one of the greatest scientific "hits" of the 20st century. This unique concept will show that everything we need to know is available.

The content of information fields is non-local, which means that it is accessible by everyone anywhere in the Universe. This implies that there needs to be another way of communication which is much faster than the speed of light, but we will come back later on this!

The main key-word by describing information fields is "coherence". We will regularly come back to this issue as it is of great importance. Coherent information will have a faster implementation and a higher probability to be successfully used. What makes the content of information fields more coherent? One answer: sacred geometry! Why is that so? Because sacred geometry is the main building-block of the information fields!

Sacred geometry is a complex system of structures that involve space, time and form. Every natural or man-made pattern conforms to informative geometric patterns. By studying these patterns, insight may be gained concerning the nature, content and communication with information fields. The ancients believed that the knowledge of sacred geometry was essential to any kind or form of education. They knew that these patterns would lead to a greater and more divine awareness.

A very important issue is the structure of information fields. In order to understand their structure, we have to take the role of vacuum into consideration. In the following paragraphs we will focus on the transformation of vacuum structures into material structures. Why is this so important? We should keep in mind that the information fields do exist in space- and polar-less dimensions (remember X7 and X8), or in other words vacuum structures, which means that there are no mass and action potentials.

Metatron's Cube containing 2 dimensional images of the Platonic Solids as well as several primal forms

Since 1995 there are instruments that are able to catch vacuum field structures, and many theories have been developed. To our knowledge the platonic solids model from Robert Gansler and his German team "die Gruppe der Neuen" published in 2003 is the most likely to describe the structure of the information fields.

Vacuum does have a polarity. It is stated by Gansler that in an imaginary time-sphere, convex structures evolve that have the shape of platonic solids, which are composed of left oriented screw-strings. At the same time, in another imaginary space sphere some concave structures (also platonic solids) evolving as right oriented screw-strings. The elementary structure of matter could develop through the fusion of concave and convex, or in other words, imaginary time and space structures

into materialized space-time structures. The fusion can only take place with platonic solids that are in resonance with each other. Due to time dilation and contraction these structures suffer from tensile and compression stress. We recognize here the necessity of the organizational fields X5 and X6 of Burkhard Heim.

The simplest vacuum structure is the tetrahedron. Many structures possess a tetrahedral form, for example water, silicon dioxide molecules and also some hydrocarbons. Apart from the tetrahedron, there are also other building blocks such as the hexahedron, the octahedron, the icosahedron and the dodecahedron. Geometric forms in general do have a considerable influence on the resonant behavior of any system. The most direct and intensive information exchange takes place between elements which are similar.

That is completely inverse to what in “normal” physics exists. Those similar elements are isomorphic and do have the same form or shape. Another noteworthy issue is the fact that the geometrical structure of matter has a very strong influence on the structure of the vacuum.

Informational resonance is the basic mechanism and this along with attention and intention. All biological, non-biological or non-physical beings or entities have the capacity of experiencing attention and intention. Informational resonance is the basis of the vast majority of extra-sensory awareness. Attaining the right resonances requires to be well focused on the subject, until complete resonance is obtained. To illustrate this theory we will give two examples: remote influencing and the information storage capacity of stones.

Let's start with remote influencing. It is a well-known fact that with remote influencing some serious damage can be inflicted to people or property at remote locations. But please keep in mind that this is not advisable! The action of directing hostile intent towards a chosen target produces a feedback loop that can cause some serious long term damage to its initiator. There is no difference between a hostile intent projected at a target 2000 miles away from a face to face confrontation. Russian remote influencers' life expectancy was very short during the Cold War. But what can remote influencers do?

They can implant suggestions deep within the minds of individuals at a great distance! They can influence people during their sleep! Remote influencing is much easier when a target object is asleep, because he or she has a state of mind operating in the delta range (0 - 4 Hz), which is exactly the operating frequency of these remote influencers. But that's not all. Remote influencers can even influence the functioning of electronic equipment. It is a well-known fact that Lyn Bucanon achieved notoriety when he “influenced” a quantum event inside a military laptop, which led to a catastrophic failure.

The information storage capacity of stones, gems, minerals and crystalline structures is well documented in scientific studies. Stones are able to affect their environment according to the kind of information they emanate. Striking examples are the skull-like curved stone heads found in 1972 in Hexham and known since as the Hexham heads. Dr. Anne Ross, a distinguished Celtic scholar from Southampton, exposed the heads and reported many strange incidents related to the stones' malefic emanation.

The Hexham Heads

At a macro physical level, interactions of different ordered states explain the formation of information contours inside lattice structures with ferromagnetic regions that store information. When acoustic waves incident on the surface, electron discharge effects result at the magnetic nodes of the mineral. Potential wells of energy trapped in lattice defects may release pre-encoded information patterns, provided the energy input exceeds the energy of the information trap. This input can be achieved by focused attention, targeting the crystalline lattice (psychometric detection).

Such informational contexts reflect patterns present in the sub-quantum fluxes which are the background of quantized energy. In other words: Information directs energy! Material structures are able to store complex information matrices which at proper quantum tuning instances, can be released and transferred to equally quantum driven bio-systems. It is this mechanism that we think is the basis of the various procedures of quantum healing such as the two-point method and various others.

Be it remote influencing or gems, quantum entanglements of stone and brain act as transmission link of any given information linking with the person's awareness field, where the non-local and non-polar replications of the information's parametrical data occurs. Any quantum coupled system of replication processes results in a symmetrical presence of the same basic information content at both ends of the set up. Consciousness features considerations on human beings on the one hand and stones on the other hand are therefore justified.

A very important role is played by the DNA which functions as a multimodal antenna, transmitting and receiving signals from the surrounding fields. DNA has to be considered as a holographic system where genes are encoded through photons, EM fields and acoustics. It is a well-known fact that DNA acts as a huge photon storage area, containing the accompanying information coming from X7 and X8. The DNA emits also photons. Alexander Gurvitch started an important research project back in the 1920's around what he called "mitogenic" rays. Later, Fritz Popp developed further the idea and introduced the term "bio-photons". By this was meant a chemo-

luminescent radiation based on biological issues, not to be confounded with bioluminescence where photons are produced during enzymatic processes.

DNA

Those bio-photons are extremely weak and cannot be detected by the naked eye. It is comparable with the light of a burning candle at a distance of 2 miles. Professor Popp discovered that bio-photons are extremely coherent meaning that in case they become quantum coherent they automatically share information with other photons. The kind of coherence of bio-photons is comparable with what is detected at Bose-Einstein condensates. DNA emits bio-photons, and acts thus as storage medium for delayed coherent emissions. As soon as coherent bio-photons are emitted, complex interference patterns are produced, which are full of valuable and useful information. This information can be consciously or unconsciously processed, leading to an interesting portfolio of possibilities. The “trick” is to communicate with them in an efficient way, and to select what is needed.

Soviet researcher Alexander Frolov comes to the conclusion that DNA structure is the reflection of a structure of an existing energy-information field which has not been investigated yet. DNA can therefore be considered as a 4 dimensional resonator generating as well as receiving information signals. Understanding how to use information well, allows the development of unique communication systems that manage to obtain organism's reconstruction (rejuvenation) and, thereby, preventing degradation of biological systems.

There is a constant interaction between any system and its environment. Mostly the interaction is in the form of informational and consequent energy exchanges. Whenever a system acquires excess energy, it seeks various means to release the excess energy. This causes the system return back to its stable state. The process of oxidative stress is a part of the metabolism. In this process, the presence of free radicals is curbed by chemical substances called enzymes in the body.

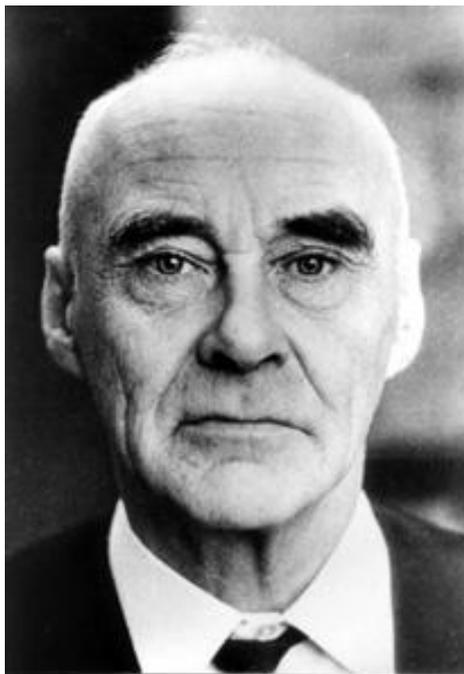

Energy and information exchange is involved in this process between the free radicals and the enzymes. It causes the cells in our body acquire the excess energy. This excess energy as well as wrong information destabilizes the cells. To remain

their stability, the cells release the excess energy in the form of photons modulated by information. Since these photons are released by the basic building blocks of life, the cells, they are called bio-photons. The entire process is random by nature. Nonetheless such a possibility of photon release is favored by the Second Law of Thermodynamics in Physics.

Bio-photonics is the branch of knowledge which deals with the study, research and applications of photons released by our body and their impact on it. Some researchers are working on the possibility of applying this obscure concept of bio-photons in curing cancer. Cancer is caused when harmful malignant cells are developed in our body and affect other healthy cells too. Since photons are basically packets of energy, they can be redirected after their generation towards the harmful cells by some mechanism. This will eventually kill the cancer cells inside the body without the intervention of any external source like chemical pills or highly energetic lasers.

Nikolai A. Kozyrev created a theory of “active properties of time” and showed experimentally that any irreversible process in a material object (i.e. the changing of entropy) generates “a wave of time density”. Detection methods show that their nature is longitudinal (a longitudinal wave is a wave where changing of energy density occurs in the direction of wave distribution). The change of human consciousness through the use of special devices, such as Kozyrev mirrors, result in clairvoyance effects.

At the same time transfer of chemicals and biological information from one biochemical or biological object to another by means of the spinning torsion fields was discovered. The role of Kozyrev holograms as well as Kozyrev space is worthwhile looking at. The reason is that many observed informational effects can be explained thereby. At this moment it is may be necessary to go into further detail on some “not so easy to grasp” principles theories and their creators.

Nikolai Kozyrev

Let's start with torsion fields. Any rotating object creates torsion fields. The concept is fairly "young" as it has only been conceived in the Soviet Union during the 1980's by a group of researchers led by Anatoly Akimov and Gennady Shipov who developed formulas that explain many types of interactions in nature. The equations provide us with pretty interesting knowledge, not only on natural processes but also on man-made processes such as communication, transport and many others. Later in this book we will introduce the reader to other difficult to believe but very accurate and correct techniques such as Hartmut Müller's Global Scaling.

Torsion fields describe these remarkable interactions by using long range spinners, focusing on the Bargmann-Michel-Telegedi equation. They possess the property of being affected by geometry (doesn't this ring a bell? Sacred geometry etc...) of material objects and/or biological fields. It is a well-known fact that various geometric patterns do emanate information modulated non-Hertzian energy waves. Dr. Buryl Payne has discovered that living organisms (humans and animals) as well as plants and fruits emanate torsion fields. Certain bio-molecules can act as superconductors, and it has been confirmed that biological systems in general exhibit non local properties.

According to Akimov, there are three types of torsion fields: electric, spin and gravity fields. It has been stated that their emanation are subtle energy fields. We do not agree with this statement, as we believe that there are rather information fields. We do not like the term "subtle energy" because "subtle" does not say anything; or there is energy, or there is no energy, but nothing in between. The fact that torsion generators can be shielded against electro-magnetic fields, without changing their effect, is already a proof that the emanations are information, having of course an energetic result.

Research shows that torsion field emanations travel at velocities up to more than 100 times the speed of light. They seem to interact with laser beams, affect biological processes, affect quartz crystals as well as electric components, modify the quality of beverages and affect gravity. These statements make our suspicion even stronger that we are talking here about the direct effects of information fields and not of energy fields. That these information fields direct and even produce energies other than conventional EM and gravitational fields is of course totally accepted.

Looking back at the recent tests of Professor William Tiller who was able to change the PH of a liquid by intention and store this intention on an electronic device, we better understand the power of information fields and working with information fields. Later we will discuss the issue of focused intent and, combined with the Heim theory and Akimov's torsion fields, move into the area of psychic realms.

According to Nikolai Kozyrev, time and rotation are closely related and interconnected. We will come back further in this book to this exceptional scientist and researcher, but for the moment we will further explore the issue of torsion fields.

Over the last three decennia, the anomalous behavior of spin-polarized particles has been researched. V.G. Baryshevski and M.I. Podgoretsky found that when neutrons are passing through spin polarized targets, a precession of neutrons, thousands of times stronger than the original magnetic field, is observed. Anomalies produced by

spin polarized protons are not new. Already in the 1960's and 1970's attraction and repulsion of circularly polarized laser beams as well as communication systems where transmitter and receiver were designed as rotating masses, have been reported.

Interesting to note is the fact that transmitted information could be received even when the receiver was shielded, which means to us that there are indeed information fields. At that time they were interpreting all this as the action of gravitational waves. The key issue however is that the effects were demonstrated by spinning objects or angular momentum. This brings us back to the work of Nikolai Kozyrev.

Other scientists have developed in the meantime generators based on rotating masses. A series of experiments conducted at the Institute of Material Research in Kiev confirmed that emanations produced by such kind of generators, are able to change their inner substance (spin structure). Noteworthy is that an identical change could be obtained by "psychics", in other words, we are back at the results obtained by William Tiller (and others). Even more interesting were the experiments of torsion radiation on various photographs. It was found possible to transmit information from one point to another. All these investigations were based on theories developed by G.I. Shipov.

Shipov used geometry of absolute parallelism and additional 6 rotational coordinates. One of the results of the experiments was that torsion fields were able to transmit information without transmitting energy! An extremely important conclusion! Depending on the spin orientation there are right and left torsion fields. Each substance possesses its own characteristic torsion field. All substances have their own stereo-chemistry determining the locations of the atoms and their spin orientation.

The superposition of the generated torsion fields determines the intensity of the torsion fields as well as the characteristic field for each substance. Now we probably better understand the unique properties of crystals. Crystals have a very well organized stereochemistry leading to strong torsion fields. The structure of a torsion field of an object can be influenced by another external torsion field leading to a new polarized state which will remain as it is after the external torsion field has disappeared.

Keeping in mind the original information field character of the torsion fields shows us their importance, especially if we consider the fact that certain configurations as described above can be recorded on any object (biological or physical).

Let's go a bit further, and consider that every magnet has an oriented magnetic moment as well as classical spin orientations, we can conclude that it has its own torsion field. This is the right explanation for the phenomena of magnetized water.

It has been shown that when electromagnetic fields exist on a certain location, there always also exist torsion fields in that same location. In other words electrostatic or electromagnetic fields are always accompanied by torsion fields. G.I. Shipov has shown that high electrical potentials generate strong torsion fields. The same for devices with organized circular or spiral electromagnetic processes.

Earlier in this chapter we mentioned the situation whereby vacuum structures are materialized, and how patterns and geometries can affect biological and physical structures. Now we go even a step further and claim that physical geometries can distort the geometry of the physical vacuum. As a matter of fact, as a result of such a distortion, torsion fields can be generated. Also here we see the manifestation of information fields. Every object will generate left and right torsion field's configured depending on its geometry. All this can be detected by various physical, chemical and biological indicators. It has been established that torsion generators allow replicating phenomena demonstrated by psychics and even effects that have never been demonstrated before.

As you can read, a lot is going on in this area. The trouble however is, that many theories are used in conjunction with names of scientists who indeed did some great research, but who are only used to give the chosen theory more weight. An example is Nikolai Kozyrev. One year ago, you could hardly find some information on this high level scientist, and today (2011), there is a growing number of websites that mention his name, and who want the readers to believe that Kozyrev invented the torsion fields.

I was very lucky to have the chance of being an ex-student of Dr. Hartmut Müller, the creator of the theory of Global Scaling at the Academy of Science at St Petersburg in Russia. It was Dr. Hartmut Müller who introduced us (his students) to the theories and R&D of people such as Kozyrev, Kaznacheyev, Garjajev, Schnoll and many others during the graduation courses of Global Scaling.

Torsion fields are absolutely an issue, but we should try to stick to the facts, and not use names of scientists in order to get more credentials. When we read what various authors write, we come to a strange mix of statements from quantum physics combining non-locality, super luminous speeds, coherence and esoteric theories leading again to the central issue of energy! Information fields are fields of information producing and directing energy, in that case also torsion fields. Burkhard Heim, Nikolai Kozyrev and Hartmut Müller have produced the basic elements that explain the availability everywhere in the Universe, and travelling synchronically at unlimited speeds.

It is important to understand that speeds limited at the speed of light make galactic or inter galactic communication impossible because this would take many light years, considering the inter galactic distances. So, to make a long story short: let's stop saying writing or thinking if torsion fields are information fields or that torsion fields transfer information or that torsion fields connect every atom and keeps any thought in its "memory". All of this does not bring us any further. Information fields contain every information of the Universe, as explained in chapter one. That this information afterwards directs or forms energy (in whatever form) is of no discussion!

Thank You...

To all our customers, partners, students and colleagues, all over the world, for sharing their enriching experiences with us.

This brought us to the knowledge standard we have today enabling us to write these papers and introduce those remarkable new concepts, for free, to all boardroom members, managers and leaders of either small or large companies.

These new concepts will give raise to unique innovations and install a new kind of leadership, this to the best of all.
