

UNDERSTANDING THE MATRIX

Successful Remote Viewing

Part 2

Geometric forms (archetypes) in general do have a considerable influence on the resonant behavior of any system. The most direct and intensive information exchange takes place between elements which are similar. That is the complete contrary to what “traditional” physics believe. Those similar elements are isomorphic and do have the same form or shape. Another noteworthy issue is the fact that any geometrical structure of archetypes has a very strong influence on the structure of the vacuum.

Since 1995 there are instruments that are able to catch vacuum field structures, and valuable theories have been developed. To our present knowledge the model from Robert Gansler and his German team “die Gruppe der Neuen” published in 2003, is the most likely to describe the structure of the information fields, and thus also from the MATRIX.

Informational resonance (along with attention and intention) is the basic mechanism of remote viewing. All biological, non-biological or non-physical beings, entities or even companies have the capacity of experiencing attention and intention. Informational resonance is the basis of the vast majority of extra-sensory awareness. Attaining the right resonances requires to be well focused on the subject, until complete resonance is obtained. In remote viewing this resonance is obtained by focusing and by sticking to the protocol.

In the first part of this article we introduced the reader to the work of Burkhard Heim, which should help us to even better understand the MATRIX.

Let us return to the 12 dimensions of Burkhard Heim:

- The first three dimensions correspond to the material world we live in.
- The fourth dimension corresponds to time.
- The fifth dimension corresponds to an implementation stage.
- The sixth dimension offers the possibilities chosen.
- The seventh and the eighth dimension represent the information fields, and finally
- ninth, tenth, eleventh and twelfth are to be considered as the hyperspace (God only knows)

Many times we receive the following question: “In how far is the theory of Burkhard Heim correct?” The answer is quite simple:

The first six dimensions describe the world we live in. Without going into details, but worthwhile mentioning, is the fact that the calculation of the values of the elementary particles we know (and on which traditional and modern physics are based upon!), can be made in greatest detail (up to 8 digits behind the comma), using the “new physics” of Heim. No other theoretical tool of traditional or even new physics is able to obtain such accurate results. This is enough prove to validate that Burkhard Heim’s calculations and models must be correct!

All mentioned fields that make up the MATRIX, contain dynamic properties of geometric structures, and it is in this geometry that we recognize the important influence and role of symbols, which we called earlier archetypes.

The Heim theory shows us a world of organizational structures, processes and systems that are constantly rebooted. In other words there is a regular reset on all levels, which offers us flexible and mature but creative opportunities. Also processes in man-made organizations are subject to information fields.

The future depends on the impulses coming from X9 – X12, and our material 3D world is the visible expression of what happens in the superior, higher dimensional fields. Creation is function of necessity, in other words, the needs with the highest probability will be created first!

Important issues are:

- We also mentioned earlier that time is the medium through which the higher dimensions come into our visible world in which we live.
- Time is therefore an active force through which information from higher dimensions (the MATRIX) come into our material world.
- Time is also the medium through which the information fields can be contacted, and a communication can be developed.
- These procedures happen through the space’s own vibrations, including the different dimensions, including time.
- Nikolay Kosyrev describes these processes as time waves.
- Through time waves information and life intelligence are spread.

Diseases, bankruptcies, accidents and other critical situations during natural or man-made processes can be steered and directed by the coordinating dimensions X5 and X6.

Knowing this, we are able to optimize organizational processes as such that during crisis situations an optimal solution can be implemented. The reason is that by being able to communicate with X7 and X8, the coordinating dimensions X5 and X6 can be re-programmed. Once again, in X7 and X8 all pure information fields (the MATRIX) of all life and technical processes are available. This explains perfectly processes such as for example the migration of the Monarch butterfly or any other beautiful examples shown by the research work of Rupert Sheldrake.

It is indeed possible to connect an object, creature or process with its original information field. This is done using intention without the use of any instrument by connecting to X9 - X12. The encountered (timeless) structures of G4 show up in our three dimensional world through time and in the form of interfering probability amplitudes guiding matter and energy.

The search for some particular information content happens by focusing on the particular content. As consciousness contents also correspond to physical processes, they are able to steer activity processes of matter.

An information analysis in the MATRIX is done via a mental orientation. Each time you think of a person, an organization, a process, an animal or any other subject or system, the components of the time pattern is reflected which is coupled to his/hers or its information field. Which aspect of this information is represented depends on the conscious selection of the person who is performing the mental orientation. A lot depends of course of the mental link of the one who is practicing the information analysis!

As a matter of fact, the MATRIX we are talking about in remote viewing is the same as the one we use in radionics. This means that informational field communication becomes now a two way process: via remote viewing we have an information collecting tool, and by the use of modern radionic systems we can influence the target in the good direction. Again, this is not only the case with life forms but also with more abstract forms such as organizations!

The role and importance of time

The density of time can be defined as being the amount of information per unit of time! This statement is probably the most important of the whole article, as for the first time the authors (Willy De Maeyer and Gabriele Breyer) have been able to make a feasible link between the theory of Burkhard Heim, underlining the active role of time between our material world, and the information levels X7 and X8. Thanks to this statement the link between the role of time and the link with information (the MATRIX content) can be visualized

Kozyrev and Nasonov were able to prove that it is possible with traditional means to diffract or reflect time waves. Results of astrophysical measurements of extra galactic objects carried out at the Crimean Astrophysical Observatory between 1975 and 1978 demonstrate that the 50 inch reflector does not only reflect and diffract electromagnetic waves but also time waves! These time waves compress local time thus deforming the crystalline structure of the detector resulting in a change in own frequency, capacity or electrical resistance.

Kozyrev used a spatially closed configuration of several aluminum plates for multiple reflections of time waves and the creation of standing time waves which will artificially compress local time. Experiments with these “Kozyrev cameras” showed that a time wave mirrored in its compression phase can lead to a local decompression of time or even cancel itself out. During the late 1980’s this research was continued by M. Arato, V. Kaznatcheev, A. Trofimov, and O. Kalinin.

Kozyrev executed reproducible experiments that proved the existence of a field beyond electromagnetism and gravity, which travels much faster than light. He called it the “flow of time.” and we have called it information fields but with an energetic consequence. Within this “flow of time,” the past, present, and future all exist at the same time, and in every place. This discovery sets the stage for all psychic phenomena to be scientifically explainable. Trofimov and Kaznacheev have, for the past thirty years, been experimentally developing the practical explanations, and have made some surprising discoveries.

The first, dubbed “Kozyrev mirrors,” reflects thought energy (which exists within the “flow of time”) back to the thinker. This apparatus, invented by Kozyrev, gives access to intensified consciousness and altered states, including non-linear time — similar to a deep meditational state.

Trofimov’s work has consisted of “remote viewing” experiments (outbounder experiments) across both distance and time. They

discovered that results are more positive when the “sender” is in the far north, where the electromagnetic field is less powerful. So they invented a second apparatus that shields an experimental subject from the local electromagnetic field. Within this apparatus, their subjects can reliably access all place and time — past, present, and future — instantaneously. Construction specifications for these systems are published in Russian scientific literature.

The conclusion of their research was that our planet’s electromagnetic field is actually the “veil” which filters time and place down to our everyday Newtonian reality — enabling us to have the human experience of linear time, in the absence of an electromagnetic field; we have access to an informational field of “instantaneous locality” that underlies our reality.

Trofimov and Kaznacheev have done, as said, excellent research work. They started in 1990 experimenting with the first generation of Kosyrev mirrors. In the meantime they are working with the seventh generation. The device used is called a mirror because of the law of optical reflection which also applies to streams other than light. When the surface is curved the energy is focused. The device is capable of creating density of the energy of time.

As you can see, remote viewing and understanding the MATRIX are both very interesting topics to deal with. The better we understand the background, the more we can appreciate the possibilities of remote viewing!
